FSUIPC4 Status of IPC Offsets for FSX

Applicable to FSUIPC4 version 4.40

Key for status indications:

	Items in blue are new to FSX
Ok-SimC	works okay using SimVars
Ok-SimC*	more or less works using SimVars, but there are difficulties (explained in Notes)
Ok-SimE	for write only, works okay, but resorting to Sim Events via SimC, not SimVar reads or writes
Ok-Intl	works okay, is internal to FSUIPC in any case
Ok-Intl*	more or less works using internal derivation, but there are difficulties (<i>explained in Notes</i>)
<mark>?-Intl</mark>	May work, untested, but FSUIPC internal in any case
?-SimC	Mapped to SimConnect variables, but validity unknown. Needs checking and feedback please
?-SimE	Mostly for write only, mapped to Sim Event, but operation unknown. Needs checking and feedback please
<mark>??</mark>	situation unknown – try it or wait for next issue
No-SimC	Not working, awaiting fix in SimConnect
No-SimE	Not working, Sim Event seems broken, needs fix in FSX?
No-SimC+	Not working, hoping for additions to SimConnect
No	Not supported. (Appeals to Pete Dowson, with reasons, please)
Not yet	Maybe can do okay, but not yet got around to it!
No info	Data unknown, not listed for SimConnect. Not yet followed through
Not tested	Maybe already okay, not tested yet
<mark>Maybe</mark>	Question mark, see italic text in "use" section
Problem	See italic text in "use" section
N/A	Not applicable

0550	8	Minimum drag velocity, ft/sec, as a double (64-bit floating point).	Ok-SimC	Νο
0558	4	INITIAL POSITION: Airspeed setting.	N/A	Ok-SimC
		Write the desired airspeed here (in knots), along with, <i>in the same IPC write</i> , those of the following fields (on-ground, LLAPBH – Lat/Lon/Alt/Pitch/Bank/Hdg) which you need to set. FSUIPC4 will use the <i>INITIAL POSITION</i> facility in FSX to place your aircraft and set the speed.		
		To set the speed at the current position (but not on ground), just write this offset and FSUIPC4 will use the following values as they currently stand.		
055C	4	INITIAL POSITION: On-ground setting.Write 0 for in-flight or 1 for on-ground here, along with, <i>in the</i>	N/A	Ok-SimC
0560	0	<i>same IPC write</i> , those of the following fields (LLAPBH – Lat/Lon/Alt/Pitch/Bank/Hdg) which you need to set. FSUIPC4 will use the <i>INITIAL POSITION</i> facility in FSX to place your aircraft. It will set the speed to 0 if the on-ground value is non-zero, but otherwise it will use the current airspeed from 02BC.	Ok-SimC	Ok-SimC
0560	8	Latitude of aircraft in FS units. (<i>Read offset 6010 for easier conversion!</i>) <u>To convert to Degrees:</u> <i>If your compiler supports long long (64-bit) integers</i> then use		

		such a variable to simply copy this 64-bit value into a double floating point variable and multiply by 90.0/(10001750.0 * 65536.0 * 65536.0). <i>Otherwise</i> you will have to handle the high 32-bits and the low 32-bits separately, combining them into one double floating point value (say dHi). To do, copy the high part (the 32-bit int at 0564) to one double and the low part (the 32-bit unsigned int at 0560) to another (say dLo). Remember that the low part is only <i>part</i> of a bigger number, so doesn't have a sign of its own. Divide dLo by (65536.0 * 65536.0) to give it its proper magnitude compared to the high part, then either add it to or subtract it from dHi according to whether dHi is positive or negative. This preserves the integrity of the original positive or negative number. Finally multiply the result by 90.0/10001750.0 to get degrees.		
		Either way, a negative result is South, positive North.		
0568	8	[Can be written to move aircraft] Longitude of aircraft in FS format.	Ok-SimC	Ok-SimC
0568	8	Longitude of aircraft in FS format. (<i>Read offset 6018 for easier conversion!</i>) <u>To convert to Degrees:</u> <i>If your compiler supports long long (64-bit) integers</i> then use such a variable to simply copy this 64-bit value into a double floating point variable and multiply by 360.0/(65536.0 * 65536.0 * 65536.0 * 65536.0). <i>Otherwise</i> you will have to handle the high 32-bits and the low 32-bits separately, combining them into one double floating point value (say dHi). To do, copy the high part (the 32-bit int at 056C) to one double and the low part (the 32-bit unsigned int at 0568) to another (say dLo). Remember that the low part is only <i>part</i> of a bigger number, so doesn't have a sign of its own. Divide dLo by (65536.0 * 65536.0) to give it its proper magnitude compared to the high part, then either add it to or subtract it from dHi according to whether dHi is positive or negative. This preserves the integrity of the original positive or negative number. Finally multiply the result by 360.0/(65536.0 * 65536.0) to get degrees. Either way, a negative result is West, positive East. If you did it all unsigned then values over 180.0 represent West longitudes of (360.0 – the value). [Can be written to move aircraft]	UK-SIIIIC	UK-SIIIIC
0570	8	Altitude, in metres and fractional metres. The units are in the high 32-bit integer (at 0574) and the fractional part is in the low 32-bit integer (at 0570). [Can be written to move aircraft] (<i>Read offset 6020 for easier conversion!</i>)	Ok-SimC	Ok-SimC

		Jet/turbo: 0=Off, 1=Start, 2=Gen; Prop: 0=Off, 1=right, 2=Left,	
		3=Both, 4=Start (see Notes in Engine 1 entry)	
09C4	2	Engine 3 combustion flag (TRUE if engine firing)	
09C6	2	Engine 3 Jet N2 as 0 – 16384 (100%)	
09C8	2	Engine 3 Jet N1 as $0 - 16384$ (100%), or Prop RPM (derive	
		RPM by multiplying this value by the RPM Scaler (see 08C8)	
		and dividing by 65536). Note that Prop RPM is signed and	
09CA	2	negative for counter-rotating propellers. Engine 3 Throttle lever, -4096 to +16384, same as 088C above	
09CA	Z	except that values written here are treated like axis inputs and are	
		disconnectable via offset 310A/B, and have the last written value	
		obtainable from offset 3334	
09D0	2	Engine 3 Fuel Flow PPH SSL (pounds per hour, standardised to	
0)00	2	sea level). Don't know units, but it seems to match some gauges	
		if divided by 128. Not maintained in all cases.	
09E2	2	Engine 3 Anti-Ice or Carb Heat switch (1=On)	
09E8	2	Engine 3 Oil temperature, $16384 = 140$ C.	
09EA	2	Engine 3 Oil pressure, 16384 = 55 psi. Note that in some aircraft	
		(eg the B777) this can exceed the 16-bit capacity of this location.	
		FSUIPC limits it to fit, i.e.65535 = 220 psi	
09EC	2	Engine 3 Pressure Ratio (where calculated): $16384 = 1.60$	
09EE	2	Engine 3 EGT, 16384 = 860 C. [Note that for Props this value is	
		not actually correct. You will get the correct value from 39F0.	
		The value here has been derived by FSUIPC to be compatible	
		with FS2004, FS2002 et cetera]	
09F0	2	Engine 3 Manifold Pressure: Inches Hg * 1024	
09F8	2	Engine 3 RPM Scaler: For Props, use this to calculate RPM – see	
		offset 09C8	
		(On turboprops this will give the shaft RPM, since there is currently no Gear Reduction Ratio available to fix values on such aircraft. I will fix this	
		when I can)	
0A00	4	Engine 3 Oil Quantity: 16384 = 100%	
0A04	4	Engine 3 Vibration: $16384 = 5.0$. This is a relative measure of	
		amplitude from the sensors on the engine which when too high is	
		an indication of a problem. The value at which you should be	
		concerned varies according to aircraft and engine.	
0A08	4	Engine 3 Hydraulic pressure: appears to be 4*psi	
0A0C	4	Engine 3 Hydraulic quantity: 16384 = 100%

		when "ApplyHeloTrim" set.		
0BC0	2	Elevator trim control input: -16383 to +16383	Ok-SimC	Ok-SimC
0BC2	2	Elevator trim indicator (follows input)	Ok-SimC	No
0BC4	2	Left brake application read-out (0 off, 16383 full: parking	Ok-SimC	Ok-SimC
		brake=16383). You can also apply a fixed brake pressure here, or		
		else use the byte at 0C01 to apply brakes emulating the keypress.		
		Note that the values READ here run from 0 to 16384, but will		
		not match exactly the values written. They seem to follow an		
		exponential curve, being much lower at the low end (e.g. only		
		33% of what is written), gradually catching up to meet at the		
ODCC	2	<i>top.</i> Right brake application read-out (0 off, 16383 full: parking	Ok-SimC	Ok-SimC
0BC6	2		OK-SIIIC	OK-SIIIC
		brake=16383). You can apply a fixed brake pressure here, or else		
		use the byte at 0C00 to apply brakes emulating the keypress.		
		Note that the values READ here run from 0 to 16384, but will		
		not match exactly the values written. They seem to follow an		
		exponential curve, being much lower at the low end (e.g. only		
		33% of what is written), gradually catching up to meet at the		
		top.		
0BC8	2	Parking brake: 0=off, 32767=on	Ok-SimC	Ok-SimE
0BC0 0BCA	2	Braking indicator: brake applied if non-zero	Ok-SimC	N/A
0.2.011	-	(1=Left, 2=Right, 3=both	_	
0BCC	4	Spoilers arm (0=off, 1=arm for auto deployment)	Ok-SimC	Ok-SimE
0BCC 0BD0	4	Spoilers control, 0 off, 4800 arm, then 5620 (7%) to 16383	Ok-SimC	Ok-SimC
		(100% fully deployed).		
		The 4800 value is set by arming. Values from 0 to somewhere		
		close to, but below, 4800 do nothing. The percentage extension		
		is the proportion of the distance in the range 4800 to 16383, even		
		though values 4800 to 5619 cannot be used—7% seems to be the		
		minimum.		

0BD4	4	Spoiler Left position indicator (0-16383)	Ok-SimC	No
0BD8	4	Spoiler Right position indicator (0-16383)	Ok-SimC	No
0BDC	4	Flaps control, 0=up, 16383=full. The "notches" for different	Ok-SimC	Ok-SimE
		aircraft are spaced equally across this range: calculate the		
		increment by 16383/(number of positions-1), ignoring fractions.		
		See also offset 3BFA below.		
		N.B. Do not expect to read this and see 100% accurate values.		
0BE0	4	Flaps position indicator (left). This gives the proportional	Ok-SimC*	No
		amount, with 16383=full deflection. It doesn't correspond to the	(see note)	
		equally spaced notches used for the control lever. If you know		
		the maximum deflection angle you can derive the current angle		
		by ((max * position indicator) / 16383).		
		This only gives the (inboard?) trailing edge flaps. Please see		
	4	offsets 30E0–30FF for greater details where needed.	Ok-SimC*	Na
0BE4	4	Flaps position indicator (right). This gives the correct	(see note)	No
		proportional amount, with 16384=full deflection. It doesn't	(000 1.000)	
		correspond to the equally spaced notches used for the control lever.		
		This only gives the inboard trailing edge flaps. Please see offsets		
		30E0–30FF for greater details where needed.

		aircraft altitude, as supplied by FSX.		
0E90	2	Ambient wind speed (at aircraft) in knots	Ok-SimC	No-SimC
0E92	2	Ambient wind direction (at aircraft), *360/65536 to get degrees	Ok-SimC	No-SimC
		Magnetic <i>or</i> True.		
		For compatibility with previous FS versions, the direction is		
		Magnetic for surface winds (aircraft below the altitude set into		
		offset 0EEE), but True for all upper winds. See offset 02A0 for		
		magnetic variation and how to convert.		
0E9A	112	FS98 style Current Aircraft Weather* as Set: details follow. [See	Ok-SimC	See 0F1A
		0F1C for Global weather <i>setting</i> area]	(but see notes)	
		N.B. See also 0E8A above, which is the "current" visibility	notesy	
		equivalent of the global setting at 0F8C.		
		* FSX supplies interpolated weather for the aircraft position,		
		including altitude. Hence for layered weather aspects the only		
		accurate values are for the altitude of the aircraft. This applies to		
		temperature and wind layers. The other layers are populated by		
		FSUIPC4 from the weather reported by the <i>nearest</i> Weather

0FF0	16		See text	Not used
	10	This was previously the Path and Filename reading facility, as		
		follows, for reading into offset 1000 one of::		
		1. The default Flight path		
		2. The AI traffic pathname for a specified AI aircraft (see		
		parameter) [FS2004 only]		

		3. The filename (no path) of the last saved Flight (FLT) file.		
		However, since version 3.47 of FSUIPC, the filename of the last saved flight has been readable directly at offset 0400. So it really isn't needed here with a complex protocol, and at present there are no plans to support the AI traffic pathname option in FSX or beyond (though if it requested I would look at placing it elsewhere).		
		So, there's only one use for the area at 1000 now and that is as shown below. Consequently, for compatibility, FSUIPC will now always set 0FF0 to zero and continually change the timestamp at 0FFC		
1000	256	The full path to the folder where FS will save flights, in UNC format (i.e. \\pcname\) if possible, otherwise local PC format (drive:\).	Ok-Intl	N/A

11BA	2	G Force: units unknown, but /624 seems to give quite sensible values.	<mark>?-SimC</mark>	<mark>?-SimC</mark>
11BE	2	Angle of Attack Indicator angle, with 360 degrees = 65536. The value 32767 is 180 degrees Angle of Attack. The angle is expressed in the usual FS 16-bit angle units (360 degrees = 65536), with 180 degrees pointing to the 0.0 position (right and down about 35 degrees in a Boeing type AofA indicator). Note that the indicator angle actually decreases as the wing AofA increases.	Ok-SimC	Νο
		The FS9 and earlier interpretation was documented as a relative		

		and the sing in 0/ \$227/7 the difference between the summer		
		value, giving in %*32767 the difference between the current		
		AofA and the maximum angle of attack for the current aircraft,		
		Really this revised understanding does not conflict with this, as		
		the indicator would presumably vary from aircraft ot aircraft in		
		any case.

		(the count is in 13FC above). Each 48 byte entry contains:	parts:	values only)
		0 double weight (lbs) (Okay in FSX)	?-simC+	
		8 double, lat dist from datum (ft) <i>(not FSX)</i>		
		16 double vert dist from datum (ft) (<i>not FSX</i>)		
		24 double longl dist from datum (ft) (<i>not FSX</i>)		
		32 char Name[16], zero at end (<i>Okay in FSX</i>)		
		There's room for up to 61 such stations here. If there are more		
		you can't access them this way.		
		These loadings can be changed, and this does have some effect,		
		but are changes are being promulgated to the overall weights		
		(offsets 30C0, 30C8, 3BFC) and balance (2EF8)? Needs		
		checking in FSX.		
1F80	40		N/A	Ok-Intl
		Write-only area for a TCAS_DATA structure, used to add entries		
		to the TCAS data tables (but NOT to create AI aircraft, please		
		note!). The 40-byte format is as for the TCAS_DATA structure		
		(see offset F080). You need to write it all as one FSUIPC_Write		
		block. You cannot read back what you have written here.		
		Very sery add means and the server (on other) offerste hefere		
		You can add more writes to the same (or other) offsets before		
		actually sending them (e.g. via FSUIPC_Process). The only		
		important thing is that the whole TCAS_DATA structure is		
		written in one block, with the length obviously set to 40.		
		The data this structure should contain is as follows:		
		id Any id number UNIQUE to all aircraft you supply. It		
		does not have to be unique to the AI aircraft. FSUIPC		
		keeps an internal flag to distinguish the two types. [Note		

		that if in the future this field is re-used for other indications, FSUIPC may have to adjust the value supplied].		
		lat, lon, alt, hdg, gs, vs, com1 As possible: all would be good, but obviously a minimum of lat/lon/alt.		
		idATC Any string of up to 14, plus a zero terminator, to identify the aircraft. This doesn't need to be unique but it could be rather confusing to the user if it isn't.		
		To erase an aircraft provide the specific id for that entry, and set the idATC field to null (i.e. zero length string, just a zero).		
		In any case, FSUIPC will automatically erase any externally supplied aircraft after about 8–12 seconds if it receives no further updates in that time. Even if the aircraft is static you'll need to supply updates for it regularly.		
		Apart from the user-adjustable range, which is applied, FSUIPC is not performing any filtering for these aircraft—i.e. you can include aircraft on the ground if required. However, once the airborne TCAS table is full (current capacity 96) whether with AI aircraft, MP aircraft, or a mixture, no others will be accepted until slots become free. So in this sense slot management is up to you.

28C0	8	Ambient air density, in slugs per cubic foot, double floating	Ok-SimC	No
		point.		
28C8	8	Ambient air pressure, in lbs per square foot, double floating	Ok-SimC	No
		point.		
28D0	8	Static air temperature, in degrees Fahrenheit, double floating	Ok-SimC	No
		point.		
28D8	8	Static air temperature, in degrees Rankine, double floating point.	Ok-SimC	No
28E0	8	"Theta", or standard temperature ratio (i.e ambient air	Ok-Intl	No
		temperature divided by the ISO standard sea level air		
		temperature), double floating point.		
		(In FSX this is currently calculated by FSUIPC)		
28E8	8	"Delta", or standard pressure ratio (ambient pressure divided by	Ok-Intl	No
		the ISO standard sea level pressure), double floating point.		
2050	0	(In FSX this is currently calculated by FSUIPC)	Ole Inti	Na
28F0	8	"Sigma", or standard density ratio (ambient density divided by	Ok-Intl	No
		the ISO standard sea level density), double floating point.		
2000	10	(In FSX this is currently calculated by FSUIPC)	N/A	Ok-SimE
2900	12	A.I. traffic control. Write all 3 32-bit values (i.e. 12 bytes)	IN/A	(part hacked)
		together to send an FS control to a specific AI aircraft. The		()
		values needed are:		
		Bytes 0–3:Aircraft Id (from the TCAS table)Bytes 4–7:The FS Control (see published lists)		
		Bytes 8–11: A parameter for the control, if needed		
		Note that most of the many hundreds of FS controls will have no		
		noticeable affect on the AI aircraft. Experimentation is needed. If		
		folks find out what does what, please let me know and I'll try to		
		publish a collated guide as an appendix later.		
		Note that you can write these values in separate FSUIPC Writes,		
		but if you do the ID must be last, as it is only when this is written		
		that the control is activated.		
		The special control value 0xFFFF (65535) is supported as a		
		request to delete the specified aircraft. (This currently uses a		
		hack into the FS code).		
290C	4	Number of Hot Joystick Button slots available for Application	Ok-Intl	N/A
		Programs to use. Currently this is fixed at 56, representing the 56		
		DWORDs available in the following offsets:		
2910	224	56 DWORDs containing zero (when free for use), or a Hot	Ok-Intl	Ok-Intl
		Joystick Button specification. See also 32FF below.		
		This "HOT BUTTON" facility allows programs to detect		
		selected joystick button presses. This facility is very similar to		
		the Hot Key system described for offset 3210. Up to 56 such hot		
		buttons can be specified, but this number is shared by all running		
		applications. The facility operates using these offsets:		
		56 32-bit values ("DWORDs") from Offset 0x2910 onwards (i.e. 0x2910_0x2914_) are 'slots' for Applications to specify Hot		
		0x2910, 0x2914) are 'slots' for Applications to specify Hot Keys These will be zero initially and zero if free The		
		Keys. These will be zero initially, and zero if free. The application must search through to find an empty slot, then set		
		this into it:		

 Byte 0 (bits 0-7): Joystick number (0-15) + 128. In other words 128 for Joystick 0, 129 for joystick 1, etc. Joysticks are numbered from 0. (Note that Windows 'Game Controllers' numbers from 1). Byte 1 (bits 8-15): Button number (0-39) Again buttons are numbered here from 0. Buttons 0-31 are the normal buttons, numbers 32-39 are a representation of the 8 "Points of View" at 45 degree angles supported by some joystick drivers for the POV Hats. Byte 2 (bits 16-23): Flags from application. This byte indicates which change is to be notified: a) for Off to On a) for Off to On a) for Off to On b) the joint off to 0 nut repeating about 6 times per second whilst it is on. Byte 3 (bits 24-31): Flags from FSUIPC. Bit 0 (value 1) is set when the specified Hot Button change occurs. Needs to be cleared by Application when seen so it can detect another. (No queuing). Bit 1 (value 2) is set when bit 0 is set only if the button is still pressed. This can be used to differentiate the two events when Byte 2 is given as "2" for both off—on and on—off events. Note: If the same Hot button is listed more than once (for instance by several applications), every copy for the same Hot

and on-off events. Note: If the same Hot button is listed more than once (for
Note: If the same Hot button is listed more than once (for
instance by several applications), every copy for the same Hot
button will get the flag set.
Use: Having found an empty slot, write the above value into it,
then monitor the highest byte of that same slot for Non-Zero.
That's the button event. Clear that byte to detect it again. If you
register several HotKey Buttons it will be more efficient to only
scan the slots themselves when a hot button actually occurs. To
detect this, just monitor the one byte at offset 32FF. (This can be
paired with 32FE to scan for buttons and keys). When it changes,
read and check the flags in your slots. (The count at 32FF may
change without any of your buttons occurring, of course, if other
applications are trapping other hot buttons).
When finished, and certainly before exit, be sure to clear the
whole DWORD to zero so other applications can use it. If you
only want to use joystick buttons for a certain part of the
operation of your program, only set the entries there and clear
them when done.
Note that if several applications want the same button, they will
all get it. Of course, your application can check through the
whole list to make sure there are no clashes/duplicates and warn
the user if so. You might have to do that at intervals in case a
clashing application is loaded after yours.
This system will work through WideFS with no problems too.

2FE0	32	FS "Add-Ons" menu access for Applications: This facility allows an application to add an entry to the Add-Ons menu. The Application finds a free Hot Key slot, then sets it up to receive notification on menu access, and writes the text needed for the menu item to another location. When the menu item is selected, the flag in the hot key slot is set just as when a hot key is used. This way of accessing the menu has the advantage that it will	N/A	Ok-SimC (see notes)
		WideFS. Of course, any response to that menu selection will occur on whichever PC the application is running.		
		To avoid having menu items relating to applications that have crashed or terminated without tidying up correctly, each menu item added is subjected to a time-out. Applications have to refresh a count in the Hot Key slot at regular intervals (10 seconds or less) otherwise the menu item is deleted and the Hot Key slot freed. The time-out is suspended when FS is paused, and there is an option to have FS pause automatically when the menu entry is selected.		
		Note that FS subjects the nuber of entries in the Add-Ons menu to a maximum of 16. FSUIPC is already using one for itself. If the maximum is already reached your entry will simply <i>not</i> appear. There is no error indication of this provided back to the Application, though a SimConnect exception may appear in the FSUIPC Log file if exception logging is enabled.		
		This is the way this facility is used:		
		1. Find a free Hot Key slot (i.e. search the 56 DWORDs at offset 0x3210 for a zero value). Say slot <i>I</i> is the one found.		
		2. Write 0x0000FFFF to the slot (i.e to the DWORD at offset 0x3210 + 4* <i>I</i>). If you want FS to pause when the menu item is selected, write 0x0002FFFF instead. The 02 part is the flag indicating that a pause is required.		
		3. Write the text for the menu entry required to offset 0x2FE0, with the first byte set to the slot number (<i>I</i>). For example, for an entry "UIPC <u>H</u> ello" (H being the shortcut) you would set the string to be written to 0x2FE0 as follows:		
		<pre>static chMenuEntry[] = "?UIPC &Hello"; chMenuEntry[0] = I;</pre>		
		4. The '&' in the string tells Windows which character to underscore, and this denotes the shortcut key, but this is optional.		
		5. The string is limited to 31 characters, including the slot number at the beginning, plus a zero terminator. In other words the offset range is 0x2FE0–0x2FFF inclusive. This area is "write only". Don't expect to be able to read back what you write here.		
		6. The write to 0x2FE0 triggers FSUIPC into asking FS to add		

		the menu entry to the Add-One main many item but this is		
		 the menu entry to the Add-Ons main menu item, but this is dependent upon the slot it references being set with 0xFF in its first (least significant) byte. From the moment the <i>slot</i> is set with 0xFF there it is changed every 55 mSecs or so, unless FS is paused or in a dialogue. The change is a decrement of the next byte in the slot—the other one you also set to 0xFF. When this reaches zero, the menu entry is removed and the slot is cleared. This gives a maximum timeout of 255 x 55mSecs, or about 14 seconds. You can make it less, of course, by initialising that byte to a lower value than 0xFF (255), but I'd recommend sticking to the maximum. This means that if you want the menu entry to stay available you must write 0xFF (or whatever) to that byte (i.e. the slot offset + 1) at regular intervals, say every 10 seconds. The 4 second leeway allows some safety, but you may want 		
		more—very little FS overhead is caused by writing that one byte every 1 second if you need to, but this is really over the top. More overhead is caused by writes when running on another PC using WideFS, so I would suggest 5 seconds as a minimum.		
		7. When the user selects your menu entry, FSUIPC will set the 2 ^{\0} (0x01) bit in the top byte (offset+3) in your slot. Just as with Hot Keys, you need to be looking for this at regular intervals, perhaps every 200 milliseconds or so. Frequent reads pose little overhead for WideFS use, but very frequent ones should really be avoided when you are running on the FS PC.		
		8. After processing the user request, whatever it is, don't forget to clear the indicator so you can detect the next one—writing zero to the byte at the offset+3 is all that is needed.		
		9. Finally, if you opted for FS to pause when the menu item is selected you need to unpause FS so that it can continue. Write zero to the 16-bit value at offset 0x262.		
		When you no longer need the menu entry, or just before terminating your program, you should write zero to the DWORD Hot Key slot. This will make FSUIPC remove the menu entry immediately. If your program does not tidy up the entry will be removed on the timeout.

3108	1	Write 1 here to disable FSUIPC's "AutoTune ADF1" facility, if	N/A	<mark>?-Intl</mark>
2100		this has been enabled by the user in FSUIPC.INI.	NI/A	0.1.4
3109	1	This is a bit-oriented control flag byte. These bits are allocated	N/A	<mark>?-Intl</mark>
		so far:		
		2^{0} (1) = 1 to disable AxisCalibration even if enabled in		
		FSUIPC.INI. Note that this "AxisCalibration" is the one		
		specifically concerned with direct offset values—see the		
		Advanced User's guide for the description of the INI parameter		
		for more details.		
		$2^{1}(2) = 1$ to allow the older (FS98-compatible) axis controls to		
		remain connected even when the main axis controls are		
		disconnected via bits in 310A and 310B below. These are AILERON_SET, ELEVATOR_SET, ELEVATOR_TRIM_SET,		
		RUDDER_SET, THROTTLE_SET and the four THROTTLEn_SET		
		controls. Allowing these through will let autopilot of FBW		
		programs control the relevant values without writing direct to the		
		appropriate offsets, but take care also that the THROTTLEn_SET		
		controls aren't being claibrated in the user's 4-throttle option		
		(page 3 in FSUIPC options).		
		$2^{7}(128)$ is reserved for external applications to use as they wish.		
		In order to protect the second form a bushess or enabled and listics		
		In order to protect the user from a broken or crashed application, the 2 ¹ flag is cleared 10 seconds after it has been set, so		
		applications will need to repeat the setting every few seconds.		
310A	1	Controls the joystick connection to the main flight controls.	N/A	<mark>?-Intl</mark>
		Normally all zero, set the following bits to actually disconnect		
		the specific joystick axes (from least significant bit = 0):		
		0 Elevator		
		1 Aileron		
		2 Rudder 2 Throttles (all)		
		 3 Throttles (all). 4 See below (throttle sync control) 		
		5 Elevator trim		
		6 Throttle #1		
		7 Throttle #2 (see next byte for others)		
		This feature is intended for use in protecting autopilot flight from		
		interference from axis flutter. In order to protect the user from a broken or graphed application all the flags are closered 10		
		broken or crashed application, all the flags are cleared 10 seconds after they have been set, so applications will need to		
		repeat the setting every few seconds.		
		If the user option is set to automatically disconnect the trim axis		
		in FS A/P vertical modes, the disconnection of Elevator inputs		
		via bit 0 above also disconnects Trim even if bit 5 is not also set. This allows existing A/D or fly by wire explications to work with		
		This allows existing A/P or fly-by-wire applications to work with those user implementations using a trim axis		
		those user implementations using a trim axis.		
		Additionally, bit 2 ⁴ is available to switch "throttle sync" on. In		
		this mode all throttles are driven from the main throttle or throttle		
		1 inputs, and other throttle inputs are discarded. (The same		
		option can also be used from an optional Hot Key).		

		See also offset 3109 above, and also offsets 3328–3339, which provide the live axis values, post calibration. These would have been applied to FS if not prevented by the flags above. Applications can use these facilities to provide a responsive "flyby-wire" control.		
310B	1	Controls the joystick connection to the slewing controls, and the	N/A	<mark>?-Intl</mark>
		other two separate throttle controls.		
		Normally all zero, set the following bits to actually disconnect the specific axes (from least significant bit = 0): 0 Slew Ahead 1 Slew Side 2 Slew Heading 3 Slew Altitude 4 Slew Bank 5 Slew Pitch 6 Throttle #3 (see previous byte for #1, #2) 7 Throttle #4 In order to protect the user from a broken or crashed application, all the flags are cleared 10 seconds after they have been set, so applications will need to repeat the setting every few seconds.		
		See also offset 3109 above.		
310C	4	Reserved		
3110	8	Operates a facility to send any 'controls' to Flight simulator. This works with <i>all</i> versions of FS & CFS. Write all 8 bytes for controls which use a value (axes and all _SET controls), but just 4 will do for 'button' types.	N/A	Ok-Inti
		This is really two 32-bit integers. The first contains the Control number (normally 65536 upwards), as seen in my FS Controls lists. The second integer is used for the parameter, such as the scaled axis value, where this is appropriate. Always write all 8 bytes in one IPC block if a parameter is used, as FSUIPC will fire the control when you write to 3110. Since version 3.40, FSUIPC-added controls (other than the offset ones) can be used via these offsets too. See the Advanced User's		
		Guide for a current list.

N/A	?-Intl
320C	4	Number of Hot Key slots available for Application Programs to use. Currently this is fixed at 56, representing the 56 DWORDs	Ok-Intl	N/A
3210	224	 available in the following offsets: 56 DWORDs containing zero (when free for use), or a Hot Key specification. See also 32FE below. Note that although up to 56 such hot keys can be specified, but this number is shared by all running applications. However, an extra key pressed before the main hotkey is released can be requested and supplied, multiplying the number of possibilities immensely without needing many slots. The facility operates using 56 32-bit values ("DWORDs") from offset 0x3210 onwards (i.e. 0x3210, 0x3214). Each of these is a 'slot' for Applications to specify Hot Keys. These will be zero initially, and zero if free. The application must search through to find an empty slot, then set this into it: Byte 0 (bits 0-7): Virtual Keycode (see the list in my FS Controls documents or the FSUIPC Advanced Users Guide). Byte 1 (bits 8-15): Shift state indicator Bit 0, the least significant, = shift Bit 1= ctrl Bit 2= alt (but use of alt strongly discouraged, see Note 1) Bit 3= "expect another keypress". If this bit is set then when the Hot Key is detected FSUIPC waits for the KEYUP or another key press first. The virtual keycode for that keypress is then returned in Byte 3, below. Bit 4= tab (provided as an extra "shift", for more key press flexibility) Byte 2 (bits 16-23): Flags from application. Bit 0 (1)=<i>reserved.</i> This was originally used to control the next option, but it was implemented incorrectly in FSUIPC, so now, to avoid problems, the bit is deliberately ignored. Bit 1 (2)= set if Hot Key should be passed through to FS, else it will be trapped. See Notes 1 & 2. Byte 3 (bits 24-31): Flags or results from FSUIPC. This byte needs to be cleared by the application so that it can detect when the Hot Key occurs. There is no queuing. If the Hot Key alone is seen, this byte is set to 1. If bit 3 was set in Byte 1 above <i>and</i> another key was pressed 	Ok-Inti	Ok-Inti
		before the hotkey was released, then the virtual keycode for the extra key (2–255) is provided here.Note 1: ALT key combinations are not a good idea, and cannot be stopped from passing to FS. You can get them, but FS will open the menu in any case.		

		Note 2 : If the same Hot key is listed more than once (for instance by several applications), every copy for the same Hot Key will get the flag set, irrespective of the pass-through option. The option only applies to finally passing it to FS. If any one Hot Key user says that the key is <i>not</i> to be passed to FS (i.e. by leaving Flag Bit 1 unset), then it isn't passed through.		
		Note 3 : FSUIPC hotkeys, allocated in its "HotKeys" page, take precedence and are not passed through to applications or FS.		
		Use: Having found an empty slot, write the above value into it, then monitor the highest byte of that same slot for Non-Zero. That's the keystroke. Clear that byte to detect it again. If you register several Hot Keys it will be more efficient to only scan the slots themselves when a hot key actually occurs. To detect this, simply monitor the one byte at offset 32FE (this can be paired with 32FF to scan for keys and buttons together). When it changes, read and check the flags in your slots. (The count at 32FE may change without any of your keys occurring, of course, if other applications are trapping other hot keys).		
		When finished, and certainly before exit, be sure to clear the whole DWORD to zero so other applications can use it. If you only want to use keystrokes for a certain part of the operation of your program, only set the entries there and clear them when done.		
		Note that if several applications want the same keystroke, they will all get it. Of course, your application can check through the whole list to make sure there are no clashes/duplicates and warn the user if so. You might have to do that at intervals in case a clashing application is loaded after yours.		
		This system will work through WideFS with no problems too.		
		Add-Ons menu access for Applications: See offset 2FE0.		
32F0	4	This DWORD controls some protected mode facilities in FSUIPC, designed to set known conditions in FSUIPC and prevent access to specific menus, whilst an application is running. Support in FSX not planned yet, and not assured.	Not yet	Not yet
32F4	2	The 16-bit ID of the last menu command item accessed in FS. Not planned for FSX.	No	No
32F6	2	FSUIPC selected technical option inhibits.	Not yet	Not yet
		Set bits here to turn <i>off</i> specific options and prevent the user turning them back on, for a limited time (max 14 seconds). To keep options turned off you need to write this mask at regular intervals (e.g. every 5 seconds).		
		Note that this is not obeyed if the user has selected to option to disallow all external control of his options. If he has done this, you can detect it by reading this location back within the time limit. If it is zero, not the value written, then the user is preventing your control over his settings.		
		Bits allocated are as follows (bit $0 = 2^0$ bit), but support for most of these isn't planned for FSX at present in any case.		

		0Reverse elevator trim sense1Fix control accelerations		
		2 Rudder spike elimination		
		3 Elevator spike elimination		
		4 Aileron spike elimination		
		5 Autopilot altitude fix (enable V/S sign corrn.)		
		6 Extend battery life		
		7 FS clock seconds sync		
32F8	1	This provides options to inhibit certain aircraft operations, for	Ok-Intl	Ok-Intl
		use in breakdown or precise control implementations. Set		
		individual bits for individual subsystems. Currently the following		
		are available, all related to hydraulic power:		
		2 ^{\0} Set to inhibit flap operation		
		2^1 Set to inhibit spoiler operation		
		2^2 Set to inhibit gear operation		
		2^3 reserved		
		2^4 Set to inhibit Engine #1 reverser		
		2^5 Set to inhibit Engine #2 reverser		
		2^6 Set to inhibit Engine #3 reverser		
		2 ⁷ Set to inhibit Engine #4 reverser		
		Note that these stop operation from axis and button controls very		
		well, and also from key presses and mouse clicks-but in these		
		latter two cases it is done by detecting a change in the system and		
		changing it back. This works, but the device will sometimes try		
		to move, and this can be noticeable, especially for some reason		
		with the flaps—the indicator gives a little jump and the noise		
		briefly starts.		
32F9	1	Brakes being used flag. This is non-zero if the user has pressed	Ok-Intl	N/A
		the brakes (left, right or both) recently. It stays non-zero for a		
		second after the last brake control or significant axis increase		
		seen. It does <i>not</i> stay set for continued constant brake pressure		
		via the axis inputs. It operates also for increasing values written to offset 0C00 or 0C01.		
32FA	2	Text display control word. You can display messages from an	N/A	Ok-SimC
52171	2	external program just like an Adventure. Write the message as a	-	(multiline
		zero-terminated string to offset 3380 (see below), subject to the		window still
		maximum of 128 characters <i>including</i> the zero terminator, then		Internal, via hack)
		write a number to this offset, 32FA, as follows:		- /
		0 display till replaced		
		+n display for n seconds, or until replaced		
		-1 display and scroll, or until replaced		
		-n display and scroll, or for n seconds,		
		or until replaced		
		In the last two cases, whether the message accells or not denor de		
		In the last two cases, whether the message scrolls or not depends		
		upon the setting of the "Options—Settings—General—Text Display" option (?). The time limit only applies when scrolling is		
		off, otherwise the message simply expires when fully scrolled off		
		the screen.		
32FC	2	AIR file change counter (incremented by FSUIPC whenever the	Ok-Intl	N/A
	-	AIR file as defined at offset 3C00 changes).		
		This is also incremented when the FS control to "reload user		
		aircraft" is detected—assign it to a joystick button or to a Key in		
		FSUIPC for this.		
				N1/A
32FE	1	Hot Key change counter, incremented by FSUIPC whenever any	Ok-Intl	N/A
32FE	1	Hot Key change counter, incremented by FSUIPC whenever any of the Hot Keys defined in the table at offset 3210 occurs and therefore has its flag set by FSUIPC.	Ok-Inti	N/A

32FF	1	Hot Button change counter, incremented by FSUIPC whenever	Ok-Intl	N/A
5211	1	any of the Hot Buttons defined in the table at offset 2910		
		changes state in the right way, and therefore has its flag set by		
		FSUIPC.		
3300	2	Additional radio and autopilot status indicators (read only	Ok-Intl	N/A
		access). Allocation by bits which are set when true. Bit $0 = \text{least}$		
		significant (value 1):		
		0 = reserved		
		1 = good NAV1		
		2 = good NAV2		
		3 = good ADF1		
		4 = NAV1 has DME		
		5 = NAV2 has DME		
		6 = NAV1 is ILS		
		7 = AP NAV1 radial acquired		
		8 = AP ILS LOC acquired (incl BC—see 10)		
		9 = AP ILS GS acquired		
		10=AP ILS LOC is BC		
		11=good ADF2		
		12=NAV2 is ILS		
		13–15 reserved		
3302	2	Assorted FSUIPC options, set by user parameters: read-only via	Not yet	N/A
		the IPC. None yet applicable for FSX.		
3304	4	FSUIPC version number:	Ok-Intl	N/A
		The HIWORD (i.e. bytes 3306-7) gives the main version as BCD		
		x 1000: e.g. 0x1998 for 1.998		
		The LOWORD (bytes 3304-5) gives the Interim build letter:		
		0=none, 1-26=a-z: e.g. 0x0005 = 'e'		
3308	2	FS version, as determined by FSUIPC: Currently only one of	Ok-Intl	N/A
		these:		
		1 = FS98		
		2 = FS2000		
		3 = CFS2		
		4 = CFS1		
		5 = reserved		
		6 = FS2002		
		7 = FS2004 "A Century of Flight"		
		8 = FSX		
		9 = ESP		
220.4	2		Ok-Intl	N/A
330A	2	Fixed <i>read-only</i> pattern, set to 0xFADE. Use this to check that	Ok-Inti	N/A
		the values in 3304-3308 are valid (Note: the supplied LIB writes		
		its version number here, but this has no effect and is only for		
330C	2	assistance when viewing LOG files).	<mark>?-Intl</mark>	N/A
330C	Z	Assorted status flags, the only ones which are of use to	:	17/7
		applications being:		
		2^1 When set this indicates that programs have full access to		
		2^1 When set this indicates that programs have full access to the IPC not. This can be read without triggering the message box		
		to users which tells them of an unaccredited access attempt. Note		
		that on WideClient it will always be set, assuming WideServer is registered on the FS PC (should always be 1 in FSUIPC4)		
		registered on the FS PC. (should always be 1 in FSUIPC4)		
		2 ² Set if the user has fully registered FSUIPC		
		2 ⁴ Set when the user Throttle Sync option (in the Hot Keys		
2205	4	page of FSUIPC options) is enabled.	Nc	Na
330E	1	Count of external IPC applications seen connecting since the	No	No
		session began. Keeps increasing till it gets to 255 then stays at		
		that value.		

330F	17	Reserved area for WideFS KeySend facility		
3320	2	This word is used to activate a facility supported by WideFS to automatically shut down the PCs running WideServer (i.e. this one) and WideClient. The .ini files of each WideFS component which is to activate the shutdown needs the "AllowShutdown=Yes" parameter included. The application performing the shut down action must write 0xABCD to this offset.	Ok-Intl	Ok-Intl
		WideServer automatically resets this word to zero 5 seconds afterwards, before it initiates its own PC's shutdown if specified. This delay is to ensure the Clients get the message before the host dies, and the clearing to zero is done so that the survivors can continue.		
		WideFS also provides the lesser option "AllowShutdown=App" which only closes down the WideClient or, in the case of WideServer, the FS session. Later still the "AppOnly" variation was added, which keeps WideClient running, ready to reload the applications when FS restarts.		
		A hot key facility to invoke this WideFS shutdown from the FS keyboard is provided via WideServer's INI parameters.		
		The pattern 0xDCBA written here invokes a "close application" action. On all WideFS PCs with any form of shutdown allowed, this pattern closes only those applications loaded by WideFS and leaves WideClient running ready to reload them. On the Server, if it is allowed, it closes FS itself. A hot key facility is provided for this variant, too.		
3322	2	WideServer version number, if enabled. Otherwise this is zero.	Ok-Intl	Ok-Intl
		This is a BCD value giving the version number x 1000, for example 0x5110 means version 5.110.		
3324	4	See also offset 333C. This is the altimeter reading in feet (or metres, if the user is running with the preference for altitudes in metres), as a 32-bit signed integer. Please check offset 0C18 to determine when metres are used (0C18 contains '2').	Ok-SimC	<mark>?-SimC</mark>
		The same value can be calculated from the actual altitude and the difference between the QNH and the altimeter "Kollsman" pressure setting, but this value ensures agreement.		
3328	2	Elevator Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	<mark>?-Intl</mark>	N/A
332A	2	Aileron Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	<mark>?-Intl</mark>	N/A
332C	2	Rudder Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	<mark>?-Intl</mark>	N/A
332E	2	Throttle Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A). This is the single throttle, applied to whichever engines are denoted by the bits in offset 0888.	<mark>?-Intl</mark>	N/A
3330	2	Throttle 1 Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	<mark>?-Intl</mark>	N/A

3332	2	Throttle 2 Axis input value, post calibration, just before being	<mark>?-Intl</mark>	N/A
		applied to the simulation (if allowed to by the byte at offset		
		310A).		
3334	2	Throttle 3 Axis input value, post calibration, just before being	<mark>?-Intl</mark>	N/A
		applied to the simulation (if allowed to by the byte at offset		
		310A).		
3336	2	Throttle 4 Axis input value, post calibration, just before being	<mark>?-Intl</mark>	N/A
3330	2	applied to the simulation (if allowed to by the byte at offset		
2220		310A).	0.1-11	51/4
3338	2	Elevator Trim Axis input value, post calibration, just before	<mark>?-Intl</mark>	N/A
		being applied to the simulation (if allowed to by the byte at offset		
		310A).		
333A	2	Throttle lower limit. This is normally 0 if no reverse is available,	<mark>?-SimC</mark>	No
		otherwise gives the reverse limit such as -4096 (for 25%).		
333C	2	WideFS flags: those used so far are:		
		2^{0} 1 = if TCP is being used, 0 if SPX		
		2^{1} 1 if connected at all, 0 is waiting for		
		connections		
		connections		
		See offect 2222 for WideES version number which also confirme		
		See offset 3322 for WideFS version number, which also confirms		
2225		that WideServer is registered and running.	Na	Na
333E	2	Weather clear count: This is incremented every time FS's "clear	Νο	No
	-	weather" routine is called, for whatever reason.		
3340	36	This area is used for externally signalled "joystick button"	Ok-Intl	Ok-Intl
		control. Each DWORD or 32 bits represents one "joystick" with		
		32 buttons. If an external program sets or clears a bit in any of		
		these 9 DWORDS the "Buttons" page in FSUIPC will register		
		the change as a button operation on one of Joystick numbers 64		
		to 73 (corresponding to the 9 DWORDs). So, FSUIPC can be		
		used to program whatever actions the user wants.		
3364	1	used to program whatever actions the user wants. FS2004 "Ready to Fly" indicator. This is non-zero when FS is	Ok-SimE	N/A

I'm not sure if FS actually simulates such events, but it appears to have allocated Gauge-accessible variables to indicate them. This byte uses bits 2^0–2^3 as flags for fires in Engines 1 to 4, respectively. 	(See note) Ok-SimE (See note) Ok-SimC	N/A Ok-SimC

		incremented each time FSUIPC is entered from FS using the		
22 (F		entry related to frame rates.	Oly hereit	
336E	2	Toe brake axes have been selected as "Set" in FSUIPC's joystick	Ok-Intl	N/A
		pages if this is non-zero. Byte 336E is non-zero for Left Brake,		
		byte 336F for Right Brake.		
		Note that this only means that the user has told FSUIPC to		
		handle the toe braking, by pressing "Set". It will only actually do		
		so if it sees brake messages.		
3370	4	Four single byte PFC driver "alive" counters:		
		3370 = COM port read thread alive and running		
		3371 = Elevator trim motor action (0=off, 1=up, 2=dn)		
		3372 = COM port write thread alive		
		3373 = Main FS chain alive		
		N.B. without the main FS chain running the other three aren't		
		maintained in any case, so mean nothing.		
3374	4	This is the "live" millisecond count as used in the FSUIPC Log.	Ok-Intl	N/A
		It is updated on each FS chained call to FSUIPC.		
3378	4	This is the millisecond timestamp value of the most recent line in	Ok-Intl	N/A
		the current FSUIPC Log. It is updated when each line is logged.		
337C	1	Propeller de-ice switches, $(1 = on, 0 = off)$, read for state, write	?-SimC	?-SimC
		to control: one bit for each prop, bits $0-3 = Props 1-4$		
337D	1	Structural de-ice switch, $(1 = on, 0 = off)$, read for state, write to	Ok-SimC	Ok-SimC
		control.		
337E	2	FSUIPC activity count. Simply a number that is incremented	Ok-Intl	N/A
		every time FSUIPC receives a call or message from Flight		
		Simulator. This can be used through WideFS to check if FS is		
		still active, for example. Note that when FS is loading aircraft or		
		scenery/textures, this value may not change for many seconds as		
		FSUIPC is then not getting any processor time at all.		
3380	128	Message text area:	Ok-Intl	Ok-Intl
				(see 32FA)
		The text is truncated if longer than 127 characters, there always		
		being a zero terminator provided.		
		You can <i>write</i> messages to this area, always zero terminated, for		
		display on the FS windshield or via ShowText or other		
		applications. After placing the message text, you must write the		
		16-bit timer value to offset 32FA to make FSUIPC send the		
		message (see 32FA above).	<u> </u>	
3410	2	Assorted indicator flags. These are the only ones currently set	Ok-Intl	N/A
		(bit numbers, bit $0 = 2^{0}$):		
		2 Engine 1 Reverser is set but inhibited*		
		3 Engine 2 Reverser is set but inhibited*		
		4 Engine 3 Reverser is set but inhibited*		
		5 Engine 4 Reverser is set but inhibited*		
		* Reverser inhibits are set in offset 32F8. Note that these flags		
		will be cleared only when the inhibit is removed <i>or</i> the relevant		
		throttle input goes positive (i.e. not just to idle).		NI/A
3412	2	Spoiler Axis input value, post calibration, just before being	Ok-Intl	N/A
		applied to the simulation (if allowed to by the byte at offset		
2414	-	341A). Copy this to 0BD0 for normal spoiler action.	Ole Intil	NI/A
3414	2	Flaps Axis input value, post calibration, just before being applied	Ok-Intl	N/A
		to the simulation (if allowed to by the byte at offset 341A). Copy		
241.5	-	this to 0BDC for normal flaps action.		N1/4
3416	2	Left Brake Axis input value, post calibration, just before being	Ok-Intl	N/A
		applied to the simulation (if allowed to by the byte at offset		
		341A). Copy this to 0BC4 for normal left brake action.	<u></u>	
3418	2	Right Brake Axis input value, post calibration, just before being	Ok-Intl	N/A
		applied to the simulation (if allowed to by the byte at offset		
		341A). Copy this to 0BC6 for normal right brake action.		1

341A	1	Controls the joystick connection for ancillary axis controls, currently Left and Right brake, flaps and spoiler axes. Normally all zero, set the following bits to actually disconnect the specific joystick axes (from least significant bit = 0):	N/A	OK-Inti
		 0 Left brake ("Axis Left Brake Set") 1 Right Brake ("Axis Right Brake Set") 2 Flaps 3 Spoilers 		
		This feature is intended for use in simulating relevant subsystem failures or partial failures. Programs can read the input axis values from offsets 3412–3418 above, and apply them, after appropriate modification, to the relevant FS axis offsets (at 0BC4 and 0BC6 for Brakes, 0BDC for Flaps or 0BD0 for Spoiler.		
		In order to protect the user from a broken or crashed application, the flags are cleared 10 seconds after they have been set, so applications will need to repeat the setting every few seconds.		
		Note that this byte is effectively "write only". Upon reading it

3500	24	ATC aircraft model string for currently loaded user aircraft, as	Ok-SimC	No
5500	24	declared in the AIRCRAFT.CFG file. This is limited to a		
		maximum of 24 characters, including a zero terminator.		
3518	8	This double provides the FS-set "Ambient Wind Y" value within	Not yet	N/A
5510	0	about one second of offset 3478 being written by an application,		
		to control up and down drafts. This allows such a program to		
		monitor FS/scenery arranged updrafts and adjust its actions		
		accordingly.		
3520	2	Earliest version number of connected WideClients (or clients	Ok-Intl	N/A
3320	-	which have been connected). Zero if no connections have been		
		made, or if all connected clients have been version 6.441 or		
		before.		
3541	1	This operates the FSUIPC "freeze flight position" facility. This	N/A	Ok-
	-	keeps the aircraft at the same latitude and longitude for as long as		Intl/SimC
		it is engaged. The altitude and attitude of the aircraft is free to		
		change, and, in fact, the aircraft flies as normal except for not		
		changing its position over the ground. This is apparently a very		
		useful facility for training environments.		
		For program control write a non zoro values to this are bet		
		For program control, write a non-zero values to this one byte		
		offset. This acts as a timer. The freeze will last for as long as this		
		byte is non-zero. It is used as a time, counting down 1 every timer tick of 55 mSecs or so. To retain the freeze for a good time,		
		write 255 here and do so every 5–10 seconds. Allow for WideFS		
		delays.		
		dolays.		
		Note that if FS is paused, then the freeze lasts until the pause is		
		released and re-engaged.		
3542	2	Standby altimeter pressure setting ("Kollsman" window). As	Ok-Intl	Ok-Intl
		millibars (hectoPascals) * 16. [This is used by FSUIPC to		
0.5.4.4		maintain offset 3544. It is not used by FS at all]		Ole Indi
3544	4	This is the standby altimeter reading in feet (or metres, if the user	Ok-Intl	Ok-Intl
		is running with the preference for altitudes in metres), as a 32-bit		
		signed integer. Please check offset 0C18 to determine when		
		metres are used (0C18 contains '2').		
		This value is maintained by FSUIPC using the pressure setting		
		supplied in offset 3542. It isn't used in FS itself, but is supplied		
		for additional gauges and external altimeters so that the standby		
		can be kept at the correct (or last notified) QNH whilst the main		
		altimeter is used for Standard settings (for airliners flying Flight		
		Levels).		
3548	8	Horizon bars offset, as a percentage of maximum, in floating	?-SimC	No-SimC+
		point double format. $(-100.0 \text{ down to } +100.0 \text{ up})$. On the default		
		Cessnas the maximum offset is 10 degrees.

3BD0	1	Reserved		
3BD2	2	This is a 16-bit counter that is incremented each time a FLT file is saved in FS. This applies to flights saved through FS Flights menu, the shortcut key (;), AutoSave, and via the FSUIPC flight saving facilities. The filenames of the saved flights can be read at offset 0400, or (historically) by using the path reading facility at offset 0FF0 and	Ok-SimE	N/A
3BD6	18	following. Panel failure modes (FS2002 and FS2004 only): one byte flag/control for each of the following "partial panel" gauge modes: 3BD6 ADF (both on FS2004) 3BD7 ASI 3BD8 Altimeter 3BD9 Attitude Indicator 3BDA COM (both COM1/2 in FSX) (Not writable – SimC?) 3BDB AVIONICS (was COM2 pre-FSX) (Not writable – SimC?) 3BDC Compass 3BDD Electrical (new in FSX) 3BDE Engine (see 0B6B for separate engines) 3BDF Fuel Indicator (Not writable – SimC?) 3BE0 Heading Indicator 3BE1 NAV (both NAV1/2 in FSX) (Not writable – SimC?) 3BE2 NAV (ditto) (Not writable – SimC?) 3BE3 Pitot heat 3BE4 Transponder 3BE5 Turn Co-ordinator (Not writable – SimC?)	?-SimC (See differences)	?-SimC & No-SimC+ (See exceptions)
		3BE6 Vacuum (<i>Not writable – SimC?</i>) 3BE7 VSI		
3BFA	2	Flaps détente increment. The full range of flap movement is 0– 0x3FFF (16383). Each détente position or "notch" is spaced equally over this range, no matter what flap angle is represented—a table in the AIR file gives those. To obtain the number of détentes, divide this increment value into 16383 and add 1. For example 2047 (0x7FF) would be the increment for 9 positions.	Ok- Intl/SimC	No
3BFC	4	Zero Fuel Weight, lbs * 256. This is the aircraft weight plus the	?-SimC	No
		payload weight, minus fuel. This changes as the payload is		
		adjusted.		
3C00	256	Full pathname of the current AIR file (in UNC form when applicable *). This is zero padded to fill the 256 bytes available. When this changes the 16-bit counter at 32FC is incremented, so interested programs don't have to keep on reading the whole 256 bytes to check.	Ok-SimE (small difference, see description)	No

3D00 3E00	256	Note: If you are accessing this from a Gauge, it has been reported that it will not contain the correct aircraft path until FSX loads the gauges completely and begins the update sequence PANEL_SERVICE_PRE_UPDATE PANEL_SERVICE_POST_UPDATE * Note that this was given only in local path form until FSUIPC version 4.306. Name of the current aircraft (from the "title" parameter in the AIRCRAFT.CFG file). Path of the Flight Simulator installation, down to and including the FS main folder and a following \ character. If the PC is on a Network and the drive or path is shared, then the full UNC (universal naming convention) path is given. Examples are: D:\FS2000\ (non-Network) \\\\MyMainPC\drived\FS2000\ (Network, named PC and named shared drive))	Ok-SimC Ok-Intl	No
3F00	2	 To load or save a Flight (.FLT) you first set up the pathname (and optional description) at offset 3F04 below, then write here. Write one of these values: 0 to simply load the specified flight/situation. 1 to save the flight/situation with no description 257 to save the flight/situation with a description Flights are saved in the "My Documents" FS folder. Flights are loaded by default from there too – you don't have to specify a path. If you are Loading a file, please allow time for the file to load before expecting any further meaningful response across the FSUIPC interface. FSUIPC will probably not be able to respond for several seconds even on the fastest machines. 	N/A	Ok-SimC
3F02	2	FLT/STN file loading counter (incremented by FSUIPC whenever the FLT or STN file, as defined at offset 3F04 changes or is reloaded). This word is read only—attempting to write here will do no harm.	Ok- Intl/SimC	N/A
3F04	252	 READ: Pathname of the currently loaded FLT file, excluding the FS main path (see 3E00) if applicable, else in UNC format (usable over a Network). This is zero padded to fill the 252 bytes available, or truncated if longer. When this changes (or simply reloaded) the 16-bit counter at 3F02 is incremented, so interested programs don't have to keep on reading the whole 252 bytes to check. WRITE: Write the file name for the FLT+WX file you wish to Load or Save. The name can include the final ".flt" but this will be discarded in any case. You can specify a folder (existing within FS's main folder) for Loading, but files can only be saved to your "My Documents" FS folder. If you give a path for saving, it is discarded. There must be a zero terminator. If you are writing the file, a description can also be specified, following the pathname and its zero terminator. Obviously this is limited by the space available. It must also be terminated by a zero byte, and indicated in the value written to 3F00 above. See 3F00 above for details of actually Loading or Saving the Flight or Situation so identified. B000	4096	FSX and beyond: METAR weather reading and writing (i.e. using the special FSX extended METAR strings of up to 2000 characters each): B000–B7FF = Weather writing area (WRITE) For GLOB or ICAO ID, set in C8xx area. B800–BFFF = Weather at requested location (READ) For ICAO ID or Lat/Lon written in CCxx area.	Ok-SimC	Needs testing (only first area in any case)
C000	4096	FS2004 style NWI ("New Weather Interface") areas, allowing both local and global weather data to be read and written. C000–C3FF = Interpolated weather at aircraft (READ)* C400–C7FF = Global weather "GLOB" (READ)** C800–CBFF = Weather writing area (WRITE) For GLOB or ICAO ID as specified. CC00–CFFF = Weather at requested location (READ) For ICAO ID or Lat/Lon* as specified.	Ok-SimC	Mostly okay but needs more testing (only third area in any case)
		The "read at requested location" facility is extended to read the weather at the user aircraft position, by giving an ICAO of "????". This is the same as giving the aircraft's Lat/Lon, but a bit easier. (Global is read by 'GLOB', as before). Additionally, the ICAO field can be set to " ? " to get the weather set at the nearest weather station to the user aircraft. The ICAO id of that station is returned in the ICAO field.		
		** A facility is also provided to force FSX into global-only weather, so that instructor stations, for example, can set weather reliably. This is also automatic for the AWI and FS98 interfaces. * Note that interpolated weather (at aircraft or Lat/Lon) does <i>not</i> include local layer information (for visibility, winds and temperature) other than for the layer at the aircraft altitude. The other layers are obtained from the nearest Weather Station.		
D000	20	Detecting munuous in use	Ok-Intl	Ok-Intl
(1 st use)		Detecting runways in useThis facility gives applications a better chance of detecting the runways in use at any selected airport in range (i.e. within 85nm or so of the user aircraft). The Weatherset2 program provided with FSUIPC makes use of this to show any runways currently assigned when AI traffic is active at a weather station selected by ICAO code.This is the interface for this:D000 32-bit signature (see below) D004 4 character ICAO of airport D008 32-bit timestamp D00CD00C4 bytes giving up to 2 departure runways, format: Number (1 byte), Designator (1 byte)	(via SimC) But needs proper testing!	
		D010 4 bytes giving up to 2 arrival runways, format: Number (1byte), Designator (1 byte) Runway numbers: 1–36 plus 37=N, 38=Ne, 39=E, 40=Se, 41=S,		

		42=Sw, 43=W, 44=Nw		
		Designators: 0=none, 1=L, 2=R, 3=C, 4=W		
		Procedure:		
		1. Write your signature value (generated by your program, to prevent simultaneous access by others), and the ICAO at the same time. If you use separate writes, write the ICAO first, but use one FSUIPC_Process call.		
		2. Read the timestamp. This is best done in the same FSUIPC_Process call as the writes.		
		3. Read the ICAO, timestamp and 8 bytes of runway details until the timestamp changes (or until you time-out). Then check that the ICAO you read is the one you want. If so, then the runway bytes are either zero (if there aren't any known) or they are filled in for you.		
		4. Write zero to the signature to free the interface for others. If you don't do this, FSUIPC will clear it in any case within about 12-15 seconds of action 1 above.		
		Notes:		
		The runways are gleaned from the data in the tables at D040 and D840, described below, but FSUIPC is here looking through ALL the traffic, i.e. all traffic within FS's own 80–90nm radius. It is not restricted it by the user-set radius, nor the smaller ground limit.		
D000	16	Reading full AI Traffic identity strings	?-Intl/SimC	<mark>?-Intl</mark>
(2 nd use)		The offset area at D000 can also be used to read full AI aircraft data strings. To do this, proceed as follows:		
		1. Write the selected command, from list below, to D004 (32- bit DWORD)		
		2. Read the timestamp at D008 (32-bit DWORD)		
		3. Write the AI id (from the TCAS table, see earlier) to D00C (32-bit DWORD)		
		4. Write a signature to D000 (32-bit DWORD)		
		It is probably best to do all that in one FSUIPC Process call—in recent versions of WideFS the read should be separated out for you in any case. The order isn't important except that you must write the signature last.		
		If you want to do another within 14 seconds, use the same signature. Use a signature of zero to allow anyone to do the same thing at the same time, but then be aware that your data may not be what you asked for.		
		5. Wait till the timestamp in D008 changes.		
		6. Read string result (up to 48 bytes including terminating zero) from D010.		
		The command values available are:		
		 1 = Tail Number 2 = Airline name + Flight number 3 = ATC aircraft type, plus ATC aircraft model * 4 = Aircraft title 5 = ATC aircraft type + last 3 digits of tail number 		

		* The aircraft type is one zero-terminated string, and the model is		
		another, following immediately. If either are missing you'll still get the null string (i.e. just the zero terminator).		
		Except for the last case where 3 digits are extracted deliberately (in accordance with ATC practice), none of these strings are likely to be abbreviated, except perhaps any long Aircraft Titles. In other words don't expect the string read in command 2 to be the same as the 14 character version in the TCAS tables—though the beginning and end will be, of course.

F068 BYTE[8] option settings for Airborne tables. See * below.	
F07E WORD the FSUIPC offset for the slot with the nearest airborne aircraft to the user aircraft.	
* The 8 bytes at offset F068 contain the current option settings for Airborne aircraft. They are used as follows:	
Byte 0 Range in nm ($0 =$ unlimited). Default is 40nm.	
Byte 1 Not used.	
Byte 2 The TCASid option setting, thus:	

		0 = Tail number 1 = Airline + Flight number 2 = Type 3 = Title 4 = Type + last 3 digits or tail number 5 = Model Byte 3 Not used Bytes 4–7 Reserved. Normally most of these options will be as set by the user via the FSUIPC options dialogue or INI file. Applications can change them by writing to these bytes, independently for ground and airborne traffic. However, FSUIPC will automatically re-instate the user's settings in approximately 20 seconds after the last write to any one of these bytes (airborne or ground). If an application wants to continue with changed settings it must re- write that changed setting at regular intervals. I would suggest using an interval of no more than 5 seconds in order to allow for delays when Networking is being used or FS is under other loads.
